

Spider Vein Treatment Options Reflect Advances in Vein Care

September 09, 2026

SANDY, UT - September 09, 2026 -

Patients seeking care for visible spider veins and varicose veins have access to a broader range of minimally invasive treatment approaches than was common in previous generations of vein care. Utah Vein Specialists is highlighting the availability of these modern options as part of its approach to evaluating and treating venous conditions, tailored to each patient's symptoms, vein health, and treatment goals.

The development of minimally invasive vein procedures has changed how many venous conditions are evaluated and treated. Traditional vein stripping, once a familiar surgical approach for problematic veins, involved removing affected veins through incisions. Modern vein care can involve procedures performed through less invasive techniques, depending on the condition being treated and the patient's individual circumstances.

For Utah Vein Specialists, the expanded availability of these treatment options represents a shift in how patients can approach concerns involving both spider and varicose veins. Rather than assuming that every patient requires the same procedure, the practice begins with an assessment designed to identify the nature of the vein condition and determine which treatment approaches may be appropriate.

Spider veins are small, visible blood vessels that commonly appear on the legs and can form red, purple, or blue patterns beneath the skin. They are often viewed primarily as a cosmetic concern, but an evaluation can help determine whether other venous issues should also be considered. Patients interested in spider vein treatment can discuss their concerns during a vein screening before deciding whether treatment is appropriate.

Varicose veins may require a different clinical approach. These enlarged or twisted veins can be accompanied by symptoms such as aching, heaviness, swelling, or discomfort. A professional evaluation allows clinicians to consider the patient's symptoms and vascular health when determining whether treatment is warranted and which options may be appropriate.

At Utah Vein Specialists, Dr. Jensen and the clinical team conduct an initial vein screening to assess each patient's individual circumstances. The evaluation includes a discussion of symptoms and treatment goals, as well as an examination of vein health. This information is used to develop a treatment plan appropriate to the patient's condition rather than applying a single approach across all cases.

For patients considering spider vein treatment, understanding the distinction between visible surface veins and underlying venous conditions can be an important part of making an informed decision. A screening can provide an opportunity to discuss whether treatment is appropriate, what options may be available, and what patients can reasonably expect from the process.

The same individualized approach applies to people experiencing symptoms associated with varicose veins. Pain, swelling, heaviness, and other concerns may warrant evaluation, particularly when symptoms interfere with regular activities. Treatment recommendations depend on the findings of the clinical assessment and the patient's specific needs.

Utah Vein Specialists is making information about modern vein treatment options available to patients who may still associate vein care with older surgical procedures. The practice's current approach reflects the wider availability of minimally invasive techniques and emphasizes evaluation before treatment selection.

More information about vein screenings and available treatment options is available at <https://www.veinsmatter.com/>. The website provides additional information for patients researching vein care and considering whether an evaluation may be appropriate.

Utah Vein Specialists provides vein evaluation and treatment for patients with spider and varicose veins, as

well as related venous concerns. Led by Dr. Jensen, the practice uses individualized assessments to determine appropriate treatment options.
